

ENCODE × ARC · STABLECOIN HACKATHON · AUG 2026

Street Rail.

Streetwear + onchain move rights, settled in stablecoins on Circle's Arc.

H2H · H2A · A2A

USDC gas

EURC + cirBTC

Privy · Google login

Verified on Arcscan

THE PROBLEM

Choreographers built the internet's dance layer.

They got paid \$0.

Missing

No registry of who made which move.

\$0

paid to the choreographer behind the most-copied TikTok dance of 2025.

Missing

No settlement rail once it goes viral.

Street dance already knows how to give credit.

We give it a settlement layer.

CULTURE

"Credit or catch a fade."

Crews, battles, and callouts already enforce authorship offline. The rules exist — the receipts don't.

ONCHAIN

```
log(token, amount, cid)
```

One call. Immutable. Priced in USDC / EURC / cirBTC. Arcscan is the receipt.

WHAT WE BUILT

Two products. One repo. Same wallet.

TRACK · AGENTIC ECONOMY

Rights Registry

Log any dance move onchain in one call. AI agent quotes, pays, and files the receipt autonomously.

TRACK · DEFI

Streetwear Shop

Sneakers, snapbacks, jackets. Checkout in USDC, EURC, or cirBTC via Circle App Kits.

Four interfaces, **one rail.**

H2H

HUMAN TO HUMAN

The shop you already know.

- Browse, cart, checkout
- Privy Google login
- USDC / EURC / cirBTC pay

H2A

HUMAN TO AGENT

You delegate, the agent buys.

- Spend policy caps
- Confirm above threshold
- Auditable run ledger

A2A

AGENT TO AGENT

Two agents negotiate, no human.

- A2A 0.3 message/send
- AP2 mandates + UCP checkout
- x402 settlement

A2H

AGENT TO HUMAN

The agent starts. You get paid.

- Royalties pushed, not claimed
- Asks when over mandate
- Receipt in the inbox

All four are live in the app behind one toggle — H2H / H2A / A2A / A2H — and settle to the same contract on Arc Testnet, in stablecoins.

Nobody builds agent-to-human, because there was no rail to push value over.

H2H

HUMAN → HUMAN

Shop, cart, checkout. The interface everyone has already built.

H2A

HUMAN → AGENT

Delegate a purchase under a spend mandate. The agent buys.

A2A

AGENT → AGENT

Buyer and seller agents negotiate and settle over x402.

A2H

AGENT → HUMAN

The agent initiates. Royalties are pushed, approvals requested.

In StreetRail the Rights Agent pays the choreographer in USDC the moment a move earns, pauses when the payout breaks the AP2 mandate, and drops an Arcscan receipt in a payout inbox. Same standards stack, run outbound.

LIVE ON ARC

Shipped. Deployed. Verified.

Verified on Arcscan · USDC · EURC · cirBTC supported

You set the policy. The agent spends inside it.

01

Intent

"Buy a size L snapback under 25 USDC."

02

Policy

Per-item cap, daily cap, confirm threshold.

03

Interrupt

Above the threshold the human approves first.

04

Pay

Agent signs USDC / EURC / cirBTC from treasury.

05

Ledger

Every step logged, Arcscan tx as the receipt.

Autonomous spending in USDC · decision logic in the agent, not the UI.

A standards stack, not a custom flow.

A2A 0.3

Agent card discovery + message/send — inbound for A2A, outbound for A2H

AP2

Intent, cart, and payment mandates the buyer signs

UCP

Discovery, checkout, order + conformance self-test

x402

402 challenge, payment payload, verified receipt

Arc Testnet

USDC settlement, real tx hash on Arcscan

Buyer and seller agents negotiate live in GX mode, then settle on-chain. In A2H the same stack runs outbound: the AP2 mandate is the standing authorization, x402 settles, Arc is the receipt.

Programmable money for the culture.

MULTI-STABLECOIN CHECKOUT

Shopify catalog priced in USD, settled in USDC, EURC, or cirBTC. App Kits Unified Balance picks the token with headroom.

NANOPAYMENT ROYALTIES

arc-nanopayments streams sub-cent USDC per play back to the choreographer's wallet. Continuous, not periodic.

Every judging bullet has a feature behind it.

Meaningful use of Arc / USDC

Contract deployed + verified, USDC as gas token

Programmable money flows

Autonomous agent settlement + nanopayment royalty streams

Interoperable commerce

H2H, H2A, and A2A on A2A 0.3 + AP2 + UCP + x402

Uses App Kits

Unified Balance + Send in the streetwear checkout

Agent with decision logic

Rights Agent picks token, fee, and files log() unattended

Autonomous spending in USDC

Treasury wallet signs via Circle SCP — no manual approval

Uses Agent Stack

Circle agent-stack-starter-kits scaffolds the Rights Agent

Working today. Shipping through **Demo Day.**

SHIPPED

- ✓ Contract verified on Arcscan
- ✓ Privy Google login + embedded wallet
- ✓ 7 SKUs live in Shopify (dev store)
- ✓ USDC / EURC / cirBTC token switcher
- ✓ Mobile-tuned end to end

NEXT · AUG 9 · AUG 20

- Rights Agent GA — Gemini + Agent Stack
- Nanopayment royalty streams (per-play)
- ERC-721 receipt NFT per logged move
- Crew treasuries + on-chain cosigns
- Demo Day rehearsal + judge Q&A pack

Street dance travels through the currencies that don't hold.

~450M

People aged 15–30 across the 15 shortlisted markets

15–20M

Estimated stablecoin users in the core four hubs today

~US\$80B

Annual remittance inflows into the shortlisted markets

Nigeria 33.7%

Philippines 3.8%

Argentina 21%

South Africa 5.3%

Turkey 69.8%

In these markets a card checkout costs 10–15% in FX and demands a card most young buyers don't hold. USDC on Arc settles in seconds, for sub-cent gas, with the creator's royalty split at the moment of sale.

BUILT FOR ENCODE × ARC

Give the culture its receipts.
